# Sorghum protein body schematic

# Protein bodies and starch granules are embedded in the glutelin matrix.

- Protein bodies
- ⬡ Starch granule
- Glutelin protein matrix

# Raw Sorghum Flour

# Extrusion as Sustainable Processing Technology

**extrude** \ik-'strüd\ vb

(Webster's Ninth New Collegiate Dictionary)

Origin – Latin *extrudere* – to thrust

1. to force, press or push out
2. to shape by forcing through die

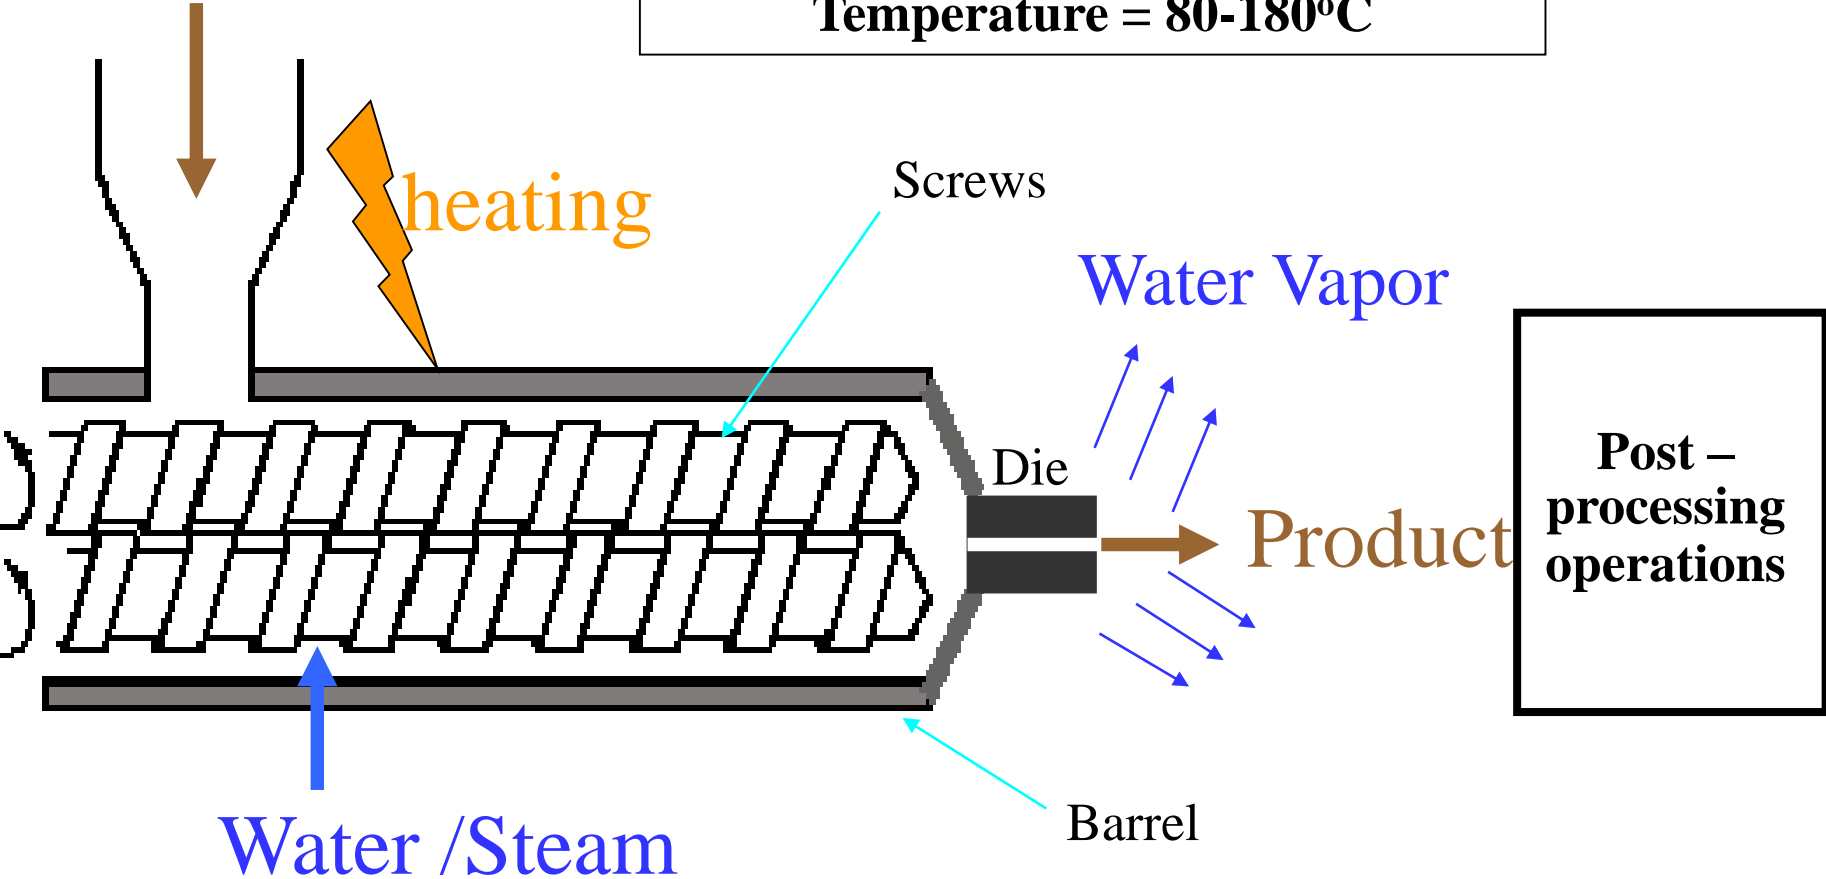

**extruder** \ik – 'strüd-ər \ n

# Extrusion cooking

Preconditioned  
feed

Moisture = 15 – 35 % wet basis (wb)  
Temperature = 80-180°C

Post –  
processing  
operations

# Extrusion Cooking Versus Conventional Batch Cooking

- Moisture (%)
- Temp (°C)
- Pressure (bar)
- Mechanical Energy/ Shear
- Time (min)

<u>Extrusion</u>	<u>Conventional</u>
15-35	70-95
150-200	80-120
20-100	1-5
Yes	No
<1	>30

# Processed/ Cooked Sorghum

Confocal Laser Scanning Microscopy (CLSM) is a useful tool in explaining the structural changes underlying the differences in digestibility.

**38 % digestibility**

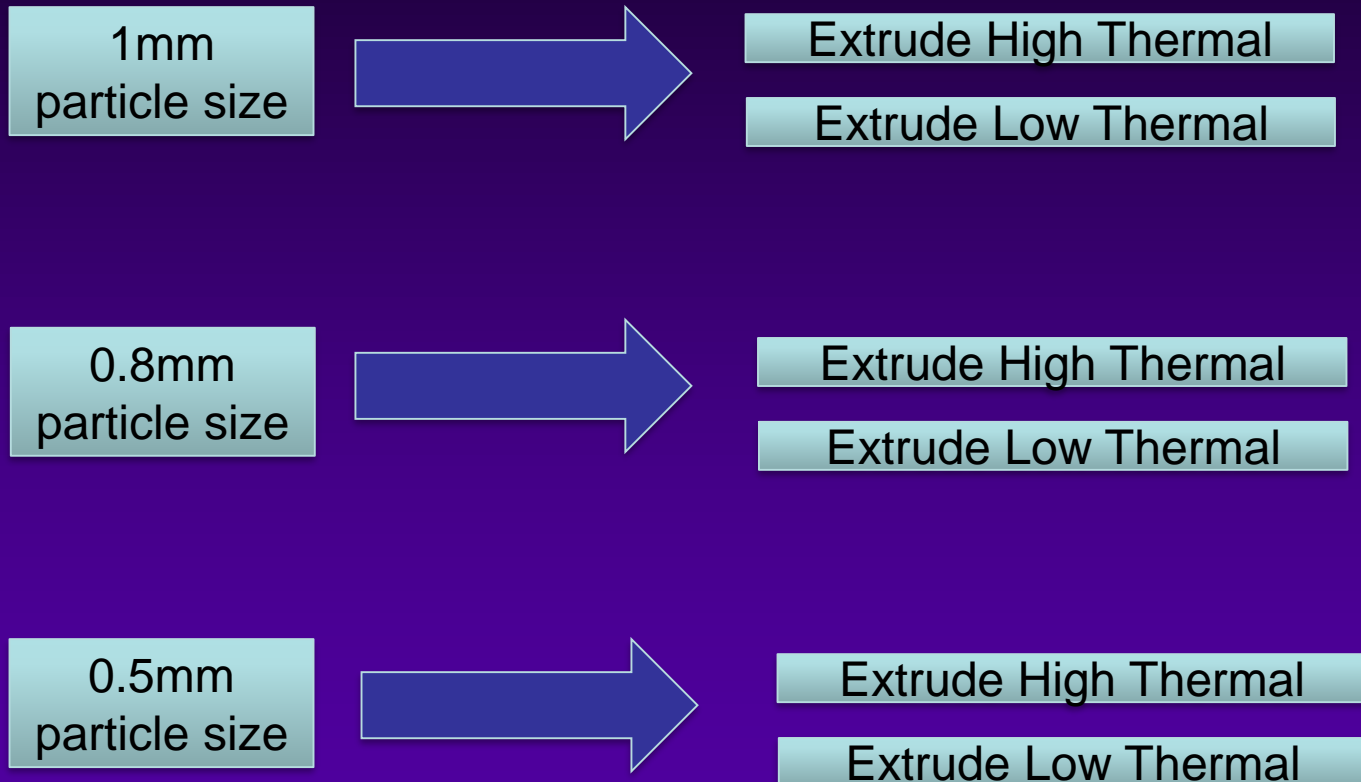

**66 % digestibility**

# Goal and Objectives

- Goal
  - Develop highly palatable premium pet food products with grain sorghum as the primary cereal ingredient
    - Based on resistant and low glycemic sorghum starch
- Objectives
  - To formulate nutritionally balanced diets with red and white sorghum
  - Different particle sizes, thermal versus mechanical energy input and extrusion.
  - In vivo studies and palatability

# 2x3x2 Experimental Design

## White and Red Sorghum Varieties

# Materials & Methods

## Diet formulation

<b>Ingredient</b>	<b>Quantity (%)</b>
<b><u>sorghum-based diet</u></b>	
<b>Sorghum (red or white variety)</b>	42.5
<b>Chicken By Product Meal</b>	35.0
<b>Poultry Fat</b>	7.0
<b>Corn Gluten Meal (60% CP)</b>	9.0
<b>Liquid palatant</b>	3.0
<b>Beet Pulp</b>	2.0
<b>Salt</b>	0.45
<b>Potassium Chloride</b>	0.35
<b>Premix Min/Vit.*</b>	0.30
<b>Choline chloride</b>	0.25
<b>Mold inhibitor</b>	0.10
<b>Antioxidant</b>	0.04

# Methods

- Batching and Mixing
- Extrusion
  - Varying Steam and Water addition
  - Wenger X-20 Single Screw Extruder
  - Wenger 4800 Series dryer

# Expansion/ Bulk Density

Treatments	Bulk Density (g/L)
Red 1.0 / 400 / low T	377.40
Red 1.0 / 300 / high T	333.93
Red 0.8 / 400 / low T	308.87
Red 0.8/ 300 / high T	318.25
Red 0.5 / 400 / low T	294.13
Red 0.5 / 300 / high T	282.25
White 1.0 / 400 / low T	363.75
White 1.0 / 300 / high T	349.25
White 0.8 / 400 / low T	324.15
White 0.8/ 300 / high T	312.10
White 0.5 / 400 / low T	301.57
White 0.5 / 300 / high T	291.10

# Particle size

**fine grind**

**coarse grind**

# Starch Gelatinization%

Treatments	Starch gelatin (%)
Red 1.0 / 400 / low T	77.28
Red 1.0 / 300 / high T	83.56
Red 0.8 / 400 / low T	85.05
Red 0.8/ 300 / high T	79.56
Red 0.5 / 400 / low T	92.2
Red 0.5 / 300 / high T	90.8
White 1.0 / 400 / low T	85.31
White 1.0 / 300 / high T	83.5
White 0.8 / 400 / low T	85.85
White 0.8/ 300 / high T	89.45
White 0.5 / 300 / high T	93.55
White 0.5 / 400 / low T	95.46

# Palatability

# In Vivo Digestibility Studies

- No significant differences between sorghum based and control (rice and corn) based diets in food intake, total apparent digestibility and fecal production/ quality
- Coarse ground recipe based products had higher concentration of colonic fermentation products (mainly propionate and butyrate); prebiotic effect?
- Post prandial glucose response – higher peak concentration for control (rice and corn) than red sorghum

## Facilities in Grain Science and Industry

Biological and Industrial Value-Added Processing (BIVAP) Facility

Extrusion Lab
